5. Equipment Under Test (E.U.T.) Description

The Cello-CANiQ addresses the mid and high-end segments of fleet management products for various advanced applications concerned with vehicle, driver and logistics management.

The Cello-CANiQ allows connectivity with various vehicle environment interfaces, including standard CANBUS and OBD interfaces, driver Identification, serial communication interfaces with 3rd party devices, discrete, analog and frequency measurement ports, voice channel, DTCO and others. All these interfaces are developed and configured for maximum flexibility in data aggregation, filtering, processing and reporting in a way which enables development of future applicative add-ons.

The Cello-CANiQ provides modular and scalable HW options (“peripherals ready” such as SD card, DTCO D8 connectivity and multiple communication technology support) as well as a highly flexible and configurable infrastructure for easy programming of the requested triggering, reaction and messaging scheme as a function of complex array of inputs received from the vehicle bus.

The Cello-CANiQ lays the infrastructure for the provisioning of field engineering services and professional services aimed at solving customer needs or market problems in short time and minimum resources.

The Cello-CANiQ supports DIRECT connectivity to vehicle data buses supporting J1939 or ISO-15765 via OBDII connector. HW form and fit are not changed and the enclosure and connectors look similar to other Cello family devices. Nevertheless, this product features a few important enhancements and improvements, such as HW compatibility with 3G modems, GPS & Glonass Hybrid positioning engine and other infrastructure changes and enablers, as described in the following sections.

The E.U.T. includes a GSM modem with FCC and IC modular approval.

7. Mode of Operation

The E.U.T. was operated, transmitting to, and receiving information from the operator, through the module. The operator sent and received the information via the auxiliary laptop.

8. Radiated Emissions

8.1 Test Specification

EN 301 511 V9.0.2: 2003, Clause 5.2.16

TS 151 010-1 V7.10.0: 2008, Clause 12.2.

8.2 Test Procedure

The test was performed in the frequency bands GSM 700 and DCS 1800

The E.U.T. was operated as described in Section 7.

A preliminary measurement to identify spurious emissions except for the fundamental and harmonics was performed inside the shielded room. The E.U.T. was tested transmitting and receiving through a passive repeater in two bands GSM700 and DCS1800. None of the spurious emissions detected were generated by the non-radio part of the unit. The E.U.T. was then transferred to the OATS.

Scanning the frequency range of 30 MHz to 4 GHz was performed. The spurious signals were recorded.

The EMI receiver was operated with 120 kHz resolution bandwidth and 300kHz video bandwidth.

The E.U.T. was replaced by the substitution antenna and a signal generator.

The signal generator was adjusted to the same level at the substitution antenna as the level measured with the E.U.T. This level was recorded.

The above tests were performed in both horizontal and vertical polarizations.

The maximum signal generator levels were recorded as the test results.

8.3 Test Results

The E.U.T met the requirements of EN 301 511 V9.0.2: 2003, Clause 5.2.16.

The margin between the spurious emission level and the specification limit is 7.97 dB in the worst case at the frequency of 1666 MHz, vertical polarization.
